# Basics

**MongoDB** is a database system that belong to a class of so called **NoSQL** database systems based on a data model different from the **relational model** and data definition, manipulation, retrieval, and administration languages different from **SQL**

MongoDB data model (**BSON**) is based a on concept of **key:value** pairs grouped into **documents** and **arrays**

MongoDB database system operates on a number of **databases**

A MongoDB **database** is a set of **collections**

A MongoDB **collection** is a set of **documents**

A MongoDB **document** is a set of **key:value** pairs

A MongoDB **value** is either an **atomic value** or a **document** or an **array**

A MongoDB **atomic value** is of one of the types included BSON specification like number, string, date, etc

A MongoDB **array** is a sequence of **values**

3/34

# Basics

Each MongoDB **key:value** pair must have a unique **key** within in a **document**

Each MongoDB **document** must have a unique identifier within a **collection**

Each MongoDB **collection** must have a unique name within a **database**

A sample BSON document

```
{ "_id": ObjectId(),  
  "full name": { "first name": "James",  
                 "initials": null,  
                 "last name": "Bond" },  
  "employee number": "007",  
  "skills": [ "cooking", "painting", "gardening" ],  
  "cars owned": [ { "rego": "007-1",  
                   "made": "Porsche" },  
                  { "rego": "007-2",  
                   "made": "Ferrari" } ],  
  "secret codes": [ [ 1, 2, 3, 4 ],  
                   [ 9, 8, 7, 5 ] ],  
  "date of birth": new Date("1960-01-01")  
}
```

# Architecture

MongoDB **flexible storage architecture** automatically manages the movement of data between storage engine technologies using native **replication**

MongoDB stores data as documents in a **binary representation** called **BSON (Binary JSON)**

MongoDB **query model** is implemented **as methods or functions within the API of a specific programming language**, as opposed to a completely separate language like **SQL**

MongoDB provides **horizontal scale-out** for databases on low cost, commodity hardware or cloud infrastructure using a technique called **sharding**, which is transparent to applications

**In-Memory storage engine** enables performance advantages of **in-memory computing** for **operational** and **real-time analytics workloads**

MongoDB **Enterprise Advanced** provides extensive capabilities to defend, detect, and control access to data (**data security**)

# Architecture

MongoDB **Ops Manager** makes easy for operations teams to deploy, monitor, backup and scale the system (system management)

MongoDB **Atlas** provides all of the features of **Database as a Service** cloud computing model

# Server

Starting MongoDB server with options `--dbpath`, `--port`, and `--bind_ip`

```
mongod --dbpath data --port 4000 --bind_ip 10.0.2.100
```

Starting MongoDB server

Starting MongoDB server with options `--dbpath`, `--port`, and server running on a `localhost`

```
mongod --dbpath data --port 4000 --bind_ip localhost
```

Starting MongoDB server

or simply ...

```
mongod --dbpath data --port 4000
```

Starting MongoDB server

Starting MongoDB command based shell

```
mongo --port 4000
```

Starting MongoDB command client

# Server

## Getting the first help from MongoDB shell

```
help
```

Getting MongoDB help

```
db.help()      help on db methods
show dbs       show database names
show collections show collections in current database
use db_name    set current database
... ..
```

MongoDB help messages

# DML

Let a file `dbload.js` contains the following `insert` methods

```
db.mycol.insert({"CITY": {"name": "Wollongong",  
                           "population": "80K",  
                           "country": "Australia",  
                           "state": "New South Wales"} });  
db.mycol.insert({"EMPLOYEE": {"enum": 1234567,  
                              "full-name": "Janusz R. Getta",  
                              "salary": "200K",  
                              "hobbies": ["cooking",  
                                          "painting",  
                                          "gardening"]} });
```

Inserting documents into a collection mycol

Processing a script inserts two documents into a collection `mycol`

```
load("dbload.js")
```

Processing a script dbload.js

Listing a collection `mycol`

```
db.mycol.find().pretty()
```

Listing a nicely formatted collection mycol

# Query language

**MongoDB** query language is based on a concept of pattern matching

A query is expressed as a **BSON** pattern and all document from a collection that match the pattern are included in an answer

A method `find()` is used to match a query pattern `{"age":25}` against the documents in a collection

Finding all documents that have a pair "age":25 at the topmost nesting level

```
db.department.find({"age":25})
```

Matching of an empty pattern `{ }` with a collection returns the returns an entire collection

Finding all documents in a collection

```
db.department.find({})
```

# Query language

## The first document

```
db.department.insert(  
  { "name": "School of Computing and Information Technology",  
    "code": "SCIT",  
    "total_staff_number": 30,  
    "budget": 1000000,  
    "address": { "street": "Northfields Ave",  
                  "bldg": 3,  
                  "city": "Wollongong",  
                  "country": "Australia" },  
    "courses": [ { "code": "CSCI835",  
                    "title": "Database Systems",  
                    "credits": 6 },  
                  { "code": "CSIT115",  
                    "title": "Data Management and Security",  
                    "credits": 6 },  
                  { "code": "CSCI317",  
                    "title": "Database Performance Tuning",  
                    "credits": 6 },  
                  { "code": "CSIT321",  
                    "title": "Software Project",  
                    "credits": 12 }  
                ]  
  }  
);
```

Created by Janusz R. Getta, CSCI235 Database Systems, Spring 2020

26/34

# Query language

## The second document

```
db.department.insert(  
  { "name": "School of Astronomy",  
    "code": "SOA",  
    "total_staff_number": 5,  
    "budget": 10000,  
    "address": { "street": "Franz Josef Str",  
                  "bldg": 4,  
                  "city": "Vienna",  
                  "country": "Austria" },  
    "courses": [ { "code": "SOA101",  
                    "title": "Astronomy for Kids",  
                    "credits": 3 },  
                  { "code": "SOA201",  
                    "title": "Black Holes",  
                    "credits": 6 },  
                  { "code": "SOA301",  
                    "title": "Dark Matter",  
                    "credits": 12 }  
                ]  
  }  
);
```

# Query language

## The third document

```
db.department.insert(  
  { "name": "School of Physics",  
    "code": "SOPH",  
    "total_staff_number": 25,  
    "budget": 100000,  
    "address": { "street": "Victoria St",  
                  "bldg": 25,  
                  "city": "Cambridge",  
                  "country": "UK" },  
    "courses": [ { "code": "SOPH101",  
                    "title": "Special Relativity",  
                    "credits": 6 },  
                  { "code": "SOPH102",  
                    "title": "General Relativity",  
                    "credits": 12 },  
                  { "code": "SOPH103",  
                    "title": "Quantum Mechanics",  
                    "credits": 18 }  
                ]  
  }  
);
```

# Query language

Find total number of documents in a collection

```
